

SAAB

Perspective on aircraft design and HPC development over 20 years

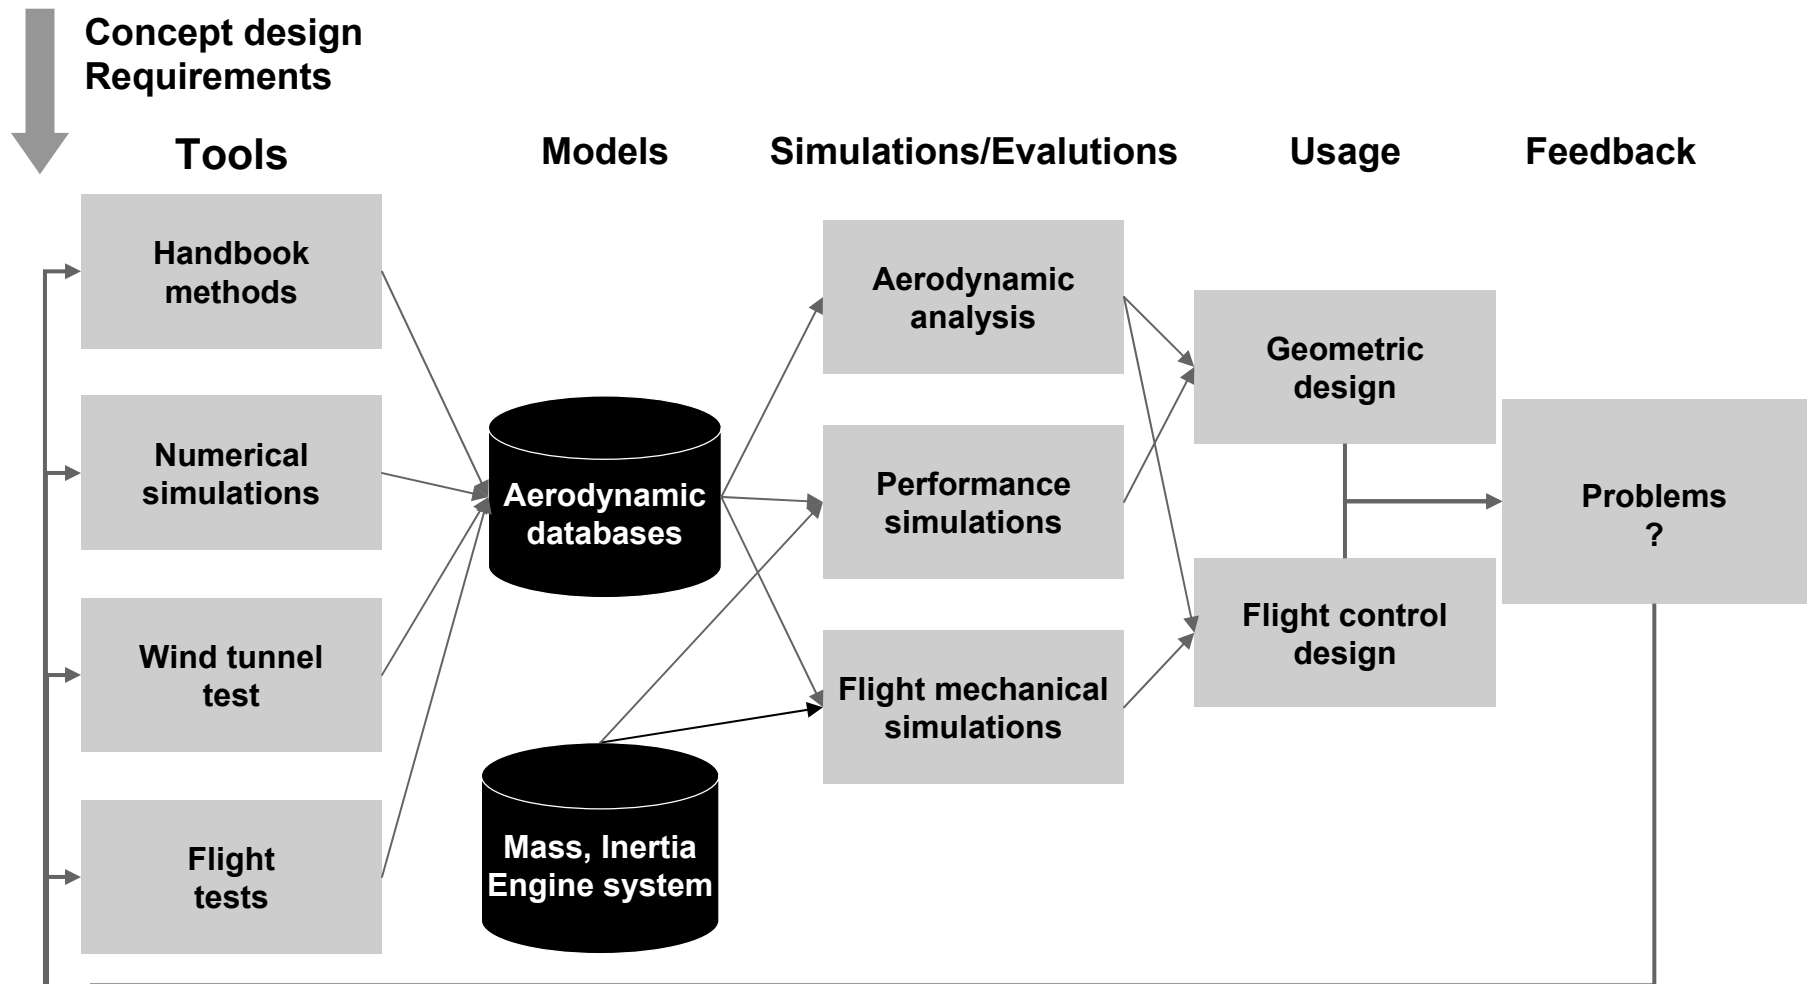

Mattias Sillén
14 October 2009

AIRCRAFT DESIGN COMPETENCE AREAS

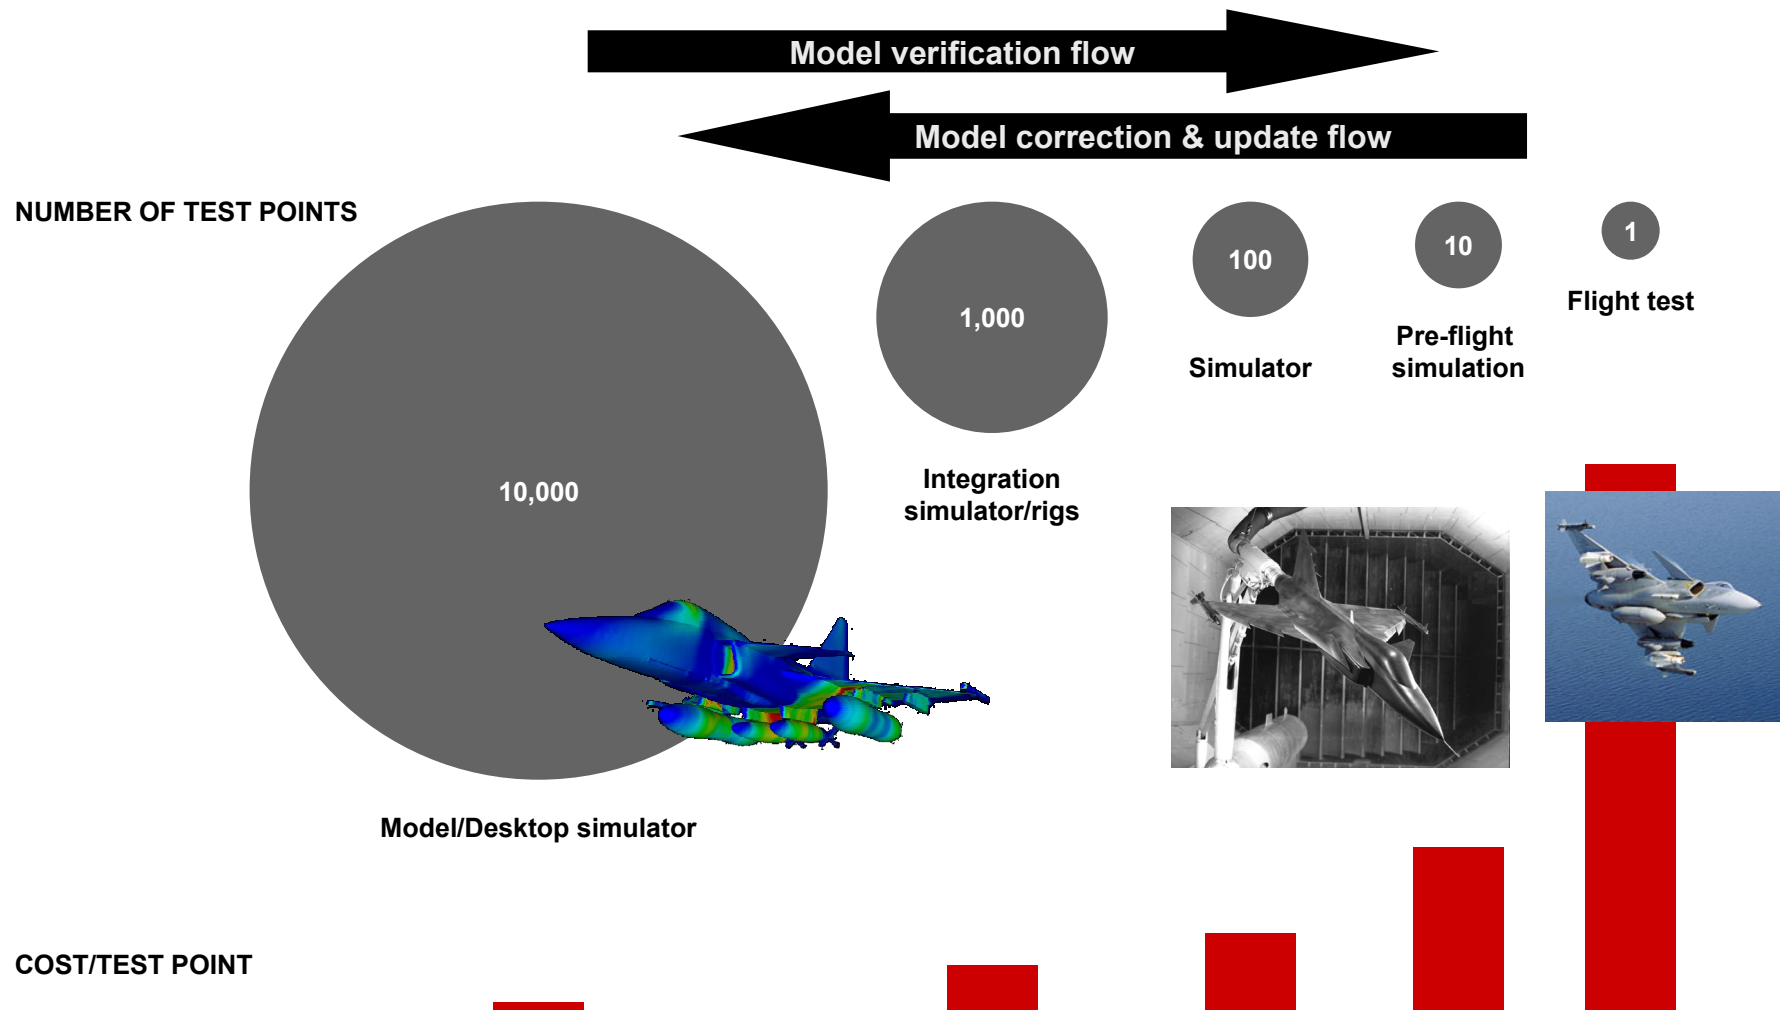

AERODYNAMIC SHAPING PROCESS

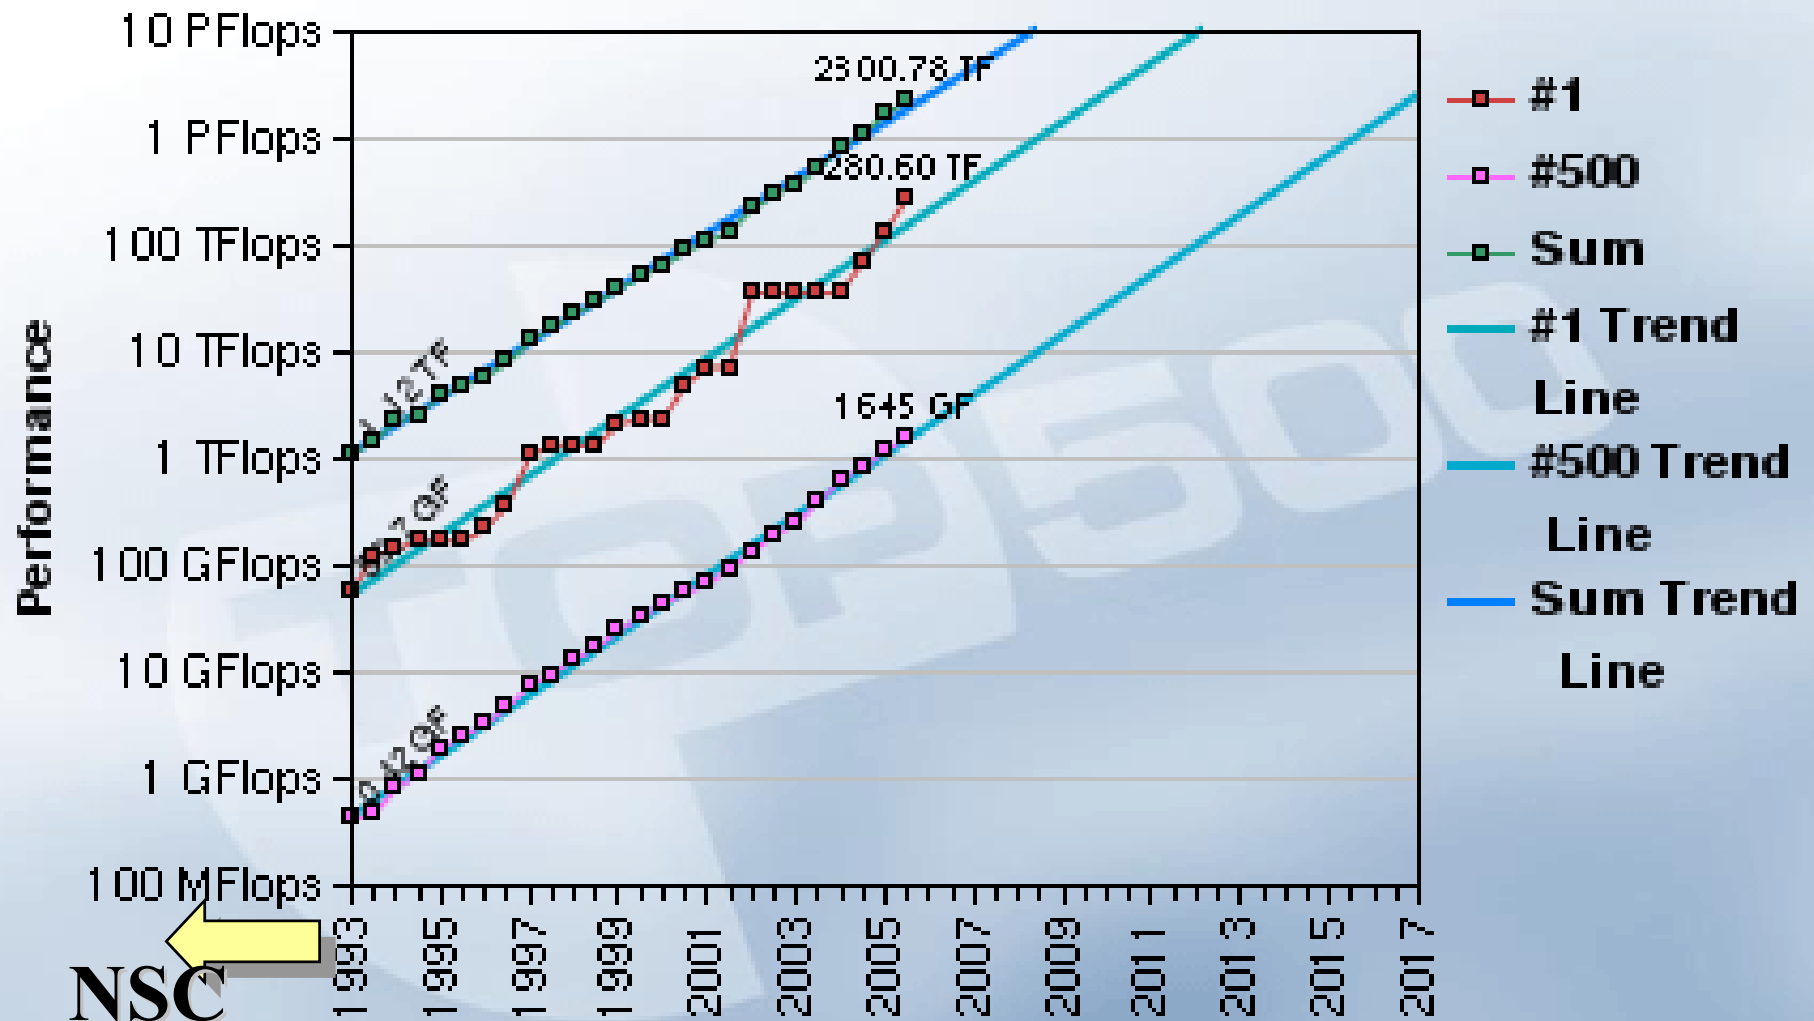

MODEL BASED DESIGN

TEST COVERAGE USING MODELS

Projected Performance Development

oment

Performance

1983 Cray 1 installed
 Panel methods for subsonic flow
 Surface discretization #1000 panels
 Run time days/hours

opment

1989 Cray X-MP installed
Inviscid flow modeling methods has matured
Volume models with 50-200 kcells
Run time days/hours

10 PFlops
1 PFlops
100 TFlops
10 TFlops

Performance

Early industrial attempts with N-S methods
1991 Cray X-MP still installed
Volume models with 1 Mcells
Months of babysitting

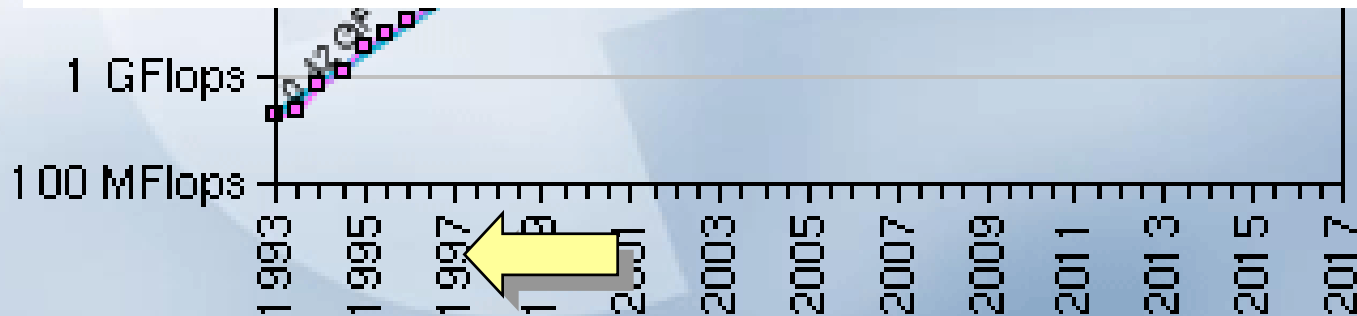

Performance Development

rend

Performance

Viscous flow simulations enter design
 Cray T3E
 Run time 1-2 days

Introduction of unstructured grids – 2-5Mpoints
 Time dependent flow simulations
 Linux Clusters
 Inviscid flow simulations in minutes/hour
 Viscous flow simulations in hours/day

Performance

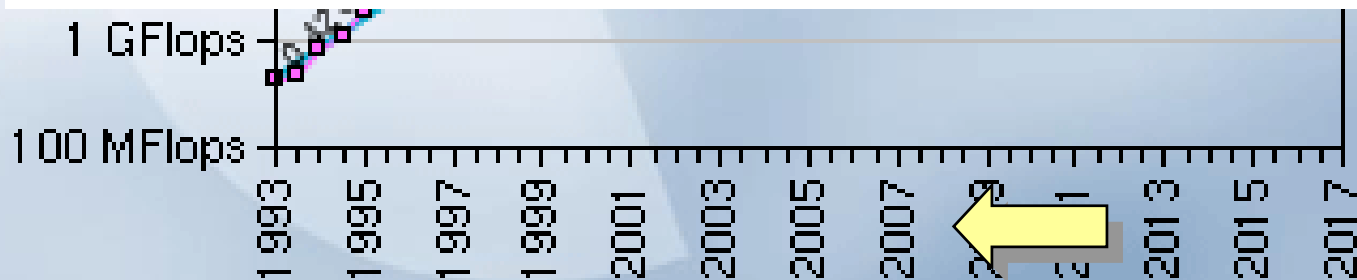

Turbulent flow modeling
Models in range 10-25 Mpoints
LinuxClusters
Run time hours-days

Performance

Flow simulations coupled with shape optimization
